Coding Style Guide

This guide extends and expands on [PSR-1], the basic coding standard.

The intent of this guide is to reduce cognitive friction when scanning code from different authors. It does so by enumerating a shared set of rules and expectations about how to format PHP code.

The style rules herein are derived from commonalities among the various member projects. When various authors collaborate across multiple projects, it helps to have one set of guidelines to be used among all those projects. Thus, the benefit of this guide is not in the rules themselves, but in the sharing of those rules.

The key words **"MUST"**, **"MUST NOT"**, **"REQUIRED"**, **"SHALL"**, **"SHALL NOT"**, **"SHOULD"**, **"SHOULD NOT"**, **"RECOMMENDED"**, **"MAY"**, and **"OPTIONAL"** in this document are to be interpreted as described in [RFC 2119].

1. Overview

- Code **MUST** follow a "coding style guide" PSR [[PSR-1]].
- Code **MUST** use 4 spaces for indenting, not tabs.
- There **MUST NOT** be a hard limit on line length; the soft limit **MUST** be 120 characters; lines **SHOULD** be 80 characters or less.
- There **MUST** be one blank line after the `namespace` declaration, and there **MUST** be one blank line after the block of `use` declarations.
- Opening braces for classes **MUST** go on the next line, and closing braces **MUST** go on the next line after the body.
- Opening braces for methods **MUST** go on the next line, and closing braces **MUST** go on the next line after the body.
- Visibility **MUST** be declared on all properties and methods; `abstract` and `final` **MUST** be declared before the visibility; `static` **MUST** be declared after the visibility.
- Control structure keywords **MUST** have one space after them; method and function calls **MUST NOT**.
- Opening braces for control structures **MUST** go on the same line, and closing braces **MUST** go on the next line after the body.
- Opening parentheses for control structures **MUST NOT** have a space after them, and closing parentheses for control structures **MUST NOT** have a space before.

1.1. Example

This example encompasses some of the rules below as a quick overview:

```
<?php
```

```
namespace Vendor\Package;
```

```
use FoolInterface;
```

```
use BarClass as Bar;
```

```
use OtherVendor\OtherPackage\BazClass;
```

```
class Foo extends Bar implements FoolInterface
```

```
{
```

```
    public function sampleFunction($a, $b = null)
```

```
    {
```

```
        if ($a === $b) {
```

```
            bar();
```

```
        } elseif ($a > $b) {
```

```
            $foo->bar($arg1);
```

```
        } else {
```

```
            BazClass::bar($arg2, $arg3);
```

```
        }
```

```
    }
```

```
    final public static function bar()
```

```
    {
```

```
        // method body
```

```
    }
```

```
}
```

2. General

2.1. Basic Coding Standard

Code **MUST** follow all rules outlined in [PSR-1].

2.2. Files

All PHP files **MUST** use the Unix LF (linefeed) line ending.

All PHP files **MUST** end with a single blank line.

The closing `?>` tag **MUST** be omitted from files containing only PHP.

2.3. Lines

There **MUST NOT** be a hard limit on line length.

The soft limit on line length **MUST** be 120 characters; automated style checkers **MUST** warn but **MUST NOT** error at the soft limit.

Lines **SHOULD NOT** be longer than 80 characters; lines longer than that **SHOULD** be split into multiple subsequent lines of no more than 80 characters each.

There **MUST NOT** be trailing whitespace at the end of non-blank lines.

Blank lines **MAY** be added to improve readability and to indicate related blocks of code.

There **MUST NOT** be more than one statement per line.

2.4. Indenting

Code **MUST** use an indent of 4 spaces, and **MUST NOT** use tabs for indenting.

N.b.: Using only spaces, and not mixing spaces with tabs, helps to avoid problems with diffs, patches, history, and annotations. The use of spaces also makes it easy to insert fine-grained sub-indentation for inter-line alignment.

2.5. Keywords and True/False/Null

PHP [keywords] MUST be in lower case.

The PHP constants `true`, `false`, and `null` MUST be in lower case.

[keywords]: <http://php.net/manual/en/reserved.keywords.php>

3. Namespace and Use Declarations

When present, there MUST be one blank line after the `namespace` declaration. When present, all `use` declarations MUST go after the `namespace` declaration.

There MUST be one `use` keyword per declaration.

There MUST be one blank line after the `use` block.

For example:

```
<?php
```

```
namespace Vendor\Package;
```

```
use FooClass;
```

```
use BarClass as Bar;
```

```
use OtherVendor\OtherPackage\BazClass;
```

```
// ... additional PHP code ...
```

4. Classes, Properties, and Methods

The term "class" refers to all classes, interfaces, and traits.

4.1. Extends and Implements

The ``extends`` and ``implements`` keywords MUST be declared on the same line as the class name. The opening brace for the class MUST go on its own line; the closing brace for the class MUST go on the next line after the body.

```
<?php
namespace Vendor\Package;

use FooClass;
use BarClass as Bar;
use OtherVendor\OtherPackage\BazClass;

class ClassName extends ParentClass implements \ArrayAccess, \Countable
{
    // constants, properties, methods
}
```

Lists of ``implements`` MAY be split across multiple lines, where each subsequent line is indented once. When doing so, the first item in the list MUST be on the next line, and there MUST be only one interface per line.

```
<?php
namespace Vendor\Package;

use FooClass;
use BarClass as Bar;
use OtherVendor\OtherPackage\BazClass;
```

class ClassName extends ParentClass implements

\ArrayAccess,

\Countable,

\Serializable

{

// constants, properties, methods

}

4.2. Properties

Visibility **MUST** be declared on all properties. The ``var`` keyword **MUST NOT** be used to declare a property. There **MUST NOT** be more than one property declared per statement. Property names **SHOULD NOT** be prefixed with a single underscore to indicate protected or private visibility.

A property declaration looks like the following.

```
<?php
```

```
namespace Vendor\Package;
```

```
class ClassName
```

```
{
```

```
    public $foo = null;
```

```
}
```

4.3. Methods

Visibility **MUST** be declared on all methods.

Method names **SHOULD NOT** be prefixed with a single underscore to indicate

protected or private visibility. Method names **MUST NOT** be declared with a space after the method name. The opening brace **MUST** go on its own line, and the closing brace **MUST** go on the

next line following the body. There **MUST NOT** be a space after the opening parenthesis, and there **MUST NOT** be a space before the closing parenthesis. A method declaration looks like the following. Note the placement of parentheses, commas, spaces, and braces:

```
<?php
namespace Vendor\Package;

class ClassName
{
    public function fooBarBaz($arg1, &$arg2, $arg3 = [])
    {
        // method body
    }
}
```

4.4. Method Arguments

In the argument list, there **MUST NOT** be a space before each comma, and there

MUST be one space after each comma. Method arguments with default values **MUST** go at the end of the argument list.

```
<?php
namespace Vendor\Package;

class ClassName
{
    public function foo($arg1, &$arg2, $arg3 = [])
    {
        // method body
    }
}
```

Argument lists **MAY** be split across multiple lines, where each subsequent line is indented once. When doing so, the first item in the list **MUST** be on the next line, and there **MUST** be only one argument per line. When the argument list is split across multiple lines, the closing parenthesis and opening brace **MUST** be placed together on their own line with one space between them.

```
<?php
namespace Vendor\Package;

class ClassName
{
    public function aVeryLongMethodName(
        ClassTypeHint $arg1,
        &$arg2,
        array $arg3 = []
    ) {
        // method body
    }
}
```

4.5. ``abstract``, ``final``, and ``static``

When present, the ``abstract`` and ``final`` declarations MUST precede the visibility declaration. When present, the ``static`` declaration MUST come after the visibility declaration.

```
<?php
namespace Vendor\Package;

abstract class ClassName
{
    protected static $foo;

    abstract protected function zim();

    final public static function bar()
    {
        // method body
    }
}
```

4.6. Method and Function Calls

When making a method or function call, there MUST NOT be a space between the method or function name and the opening parenthesis, there MUST NOT be a space after the opening parenthesis, and there MUST NOT be a space before the closing parenthesis. In the argument list, there MUST NOT be a space before each comma, and there MUST be one space after each comma.

```
<?php  
bar();  
$foo->bar($arg1);  
Foo::bar($arg2, $arg3);
```

Argument lists MAY be split across multiple lines, where each subsequent line is indented once. When doing so, the first item in the list MUST be on the next line, and there MUST be only one argument per line.

```
<?php  
$foo->bar(  
    $longArgument,  
    $longerArgument,  
    $muchLongerArgument  
);
```

5. Control Structures

The general style rules for control structures are as follows:

- There MUST be one space after the control structure keyword
- There MUST NOT be a space after the opening parenthesis
- There MUST NOT be a space before the closing parenthesis
- There MUST be one space between the closing parenthesis and the opening brace
- The structure body MUST be indented once
- The closing brace MUST be on the next line after the body

The body of each structure MUST be enclosed by braces. This standardizes how the structures look, and reduces the likelihood of introducing errors as new lines get added to the body.

5.1. `if`, `elseif`, `else`

An `if` structure looks like the following. Note the placement of parentheses, spaces, and braces; and that `else` and `elseif` are on the same line as the closing brace from the earlier body.

```
<?php
if ($expr1) {
    // if body
} elseif ($expr2) {
    // elseif body
} else {
    // else body;
}
```

The keyword `elseif` SHOULD be used instead of `else if` so that all control keywords look like single words.

5.2. `switch`, `case`

A `switch` structure looks like the following. Note the placement of parentheses, spaces, and braces. The `case` statement MUST be indented once from `switch`, and the `break` keyword (or other terminating keyword) MUST be indented at the same level as the `case` body. There MUST be a comment such as

`// no break` when fall-through is intentional in a non-empty `case` body.`

```
<?php
switch ($expr) {
    case 0:
        echo 'First case, with a break';
        break;
    case 1:
        echo 'Second case, which falls through';
        // no break
    case 2:
    case 3:
    case 4:
```

```
    echo 'Third case, return instead of break';  
    return;  
default:  
    echo 'Default case';  
    break;  
}
```

5.3. `while`, `do while`

A `while` statement looks like the following. Note the placement of parentheses, spaces, and braces.

```
<?php  
while ($expr) {  
    // structure body  
}
```

Similarly, a `do while` statement looks like the following. Note the placement of parentheses, spaces, and braces.

```
<?php  
do {  
    // structure body;  
} while ($expr);
```

5.4. `for`

A `for` statement looks like the following. Note the placement of parentheses, spaces, and braces.

```
<?php  
for ($i = 0; $i < 10; $i++) {  
    // for body  
}
```

5.5. `foreach`

A `foreach` statement looks like the following. Note the placement of parentheses, spaces, and braces.

```
<?php
foreach ($iterable as $key => $value) {
    // foreach body
}
```

5.6. `try`, `catch`

A `try catch` block looks like the following. Note the placement of parentheses, spaces, and braces.

```
<?php
try {
    // try body
} catch (FirstExceptionType $e) {
    // catch body
} catch (OtherExceptionType $e) {
    // catch body
}
```

6. Closures

Closures MUST be declared with a space after the `function` keyword, and a space before and after the `use` keyword. The opening brace MUST go on the same line, and the closing brace MUST go on the next line following the body.

There MUST NOT be a space after the opening parenthesis of the argument list or variable list, and there MUST NOT be a space before the closing parenthesis of the argument list or variable list.

In the argument list and variable list, there MUST NOT be a space before each comma, and there MUST be one space after each comma. Closure arguments with default values MUST go at the end of the argument list.

A closure declaration looks like the following. Note the placement of parentheses, commas, spaces, and braces:

```
<?php
$closureWithArgs = function ($arg1, $arg2) {
    // body
};

$closureWithArgsAndVars = function ($arg1, $arg2) use ($var1, $var2) {
    // body
};
```

Argument lists and variable lists MAY be split across multiple lines, where each subsequent line is indented once. When doing so, the first item in the list MUST be on the next line, and there MUST be only one argument or variable per line. When the ending list (whether of arguments or variables) is split across multiple lines, the closing parenthesis and opening brace MUST be placed together on their own line with one space between them. The following are examples of closures with and without argument lists and variable lists split across multiple lines.

```
<?php
$longArgs_noVars = function (
    $longArgument,
    $longerArgument,
    $muchLongerArgument
) {
    // body
};

$noArgs_longVars = function () use (
    $longVar1,
    $longerVar2,
    $muchLongerVar3
) {
    // body
};
```

```
$longArgs_longVars = function (  
  $longArgument,  
  $longerArgument,  
  $muchLongerArgument  
) use (  
  $longVar1,  
  $longerVar2,  
  $muchLongerVar3  
) {  
  // body  
};
```

```
$longArgs_shortVars = function (  
  $longArgument,  
  $longerArgument,  
  $muchLongerArgument  
) use ($var1) {  
  // body  
};
```

```
$shortArgs_longVars = function ($arg) use (  
  $longVar1,  
  $longerVar2,  
  $muchLongerVar3  
) {  
  // body  
};
```

Note that the formatting rules also apply when the closure is used directly in a function or method call as an argument.

```
<?php
$foo->bar(
    $arg1,
    function ($arg2) use ($var1) {
        // body
    },
    $arg3
);
```

7. Conclusion

There are many elements of style and practice intentionally omitted by this guide. These include but are not limited to:

- Declaration of global variables and global constants
- Declaration of functions
- Operators and assignment
- Inter-line alignment
- Comments and documentation blocks
- Class name prefixes and suffixes
- Best practices

Future recommendations MAY revise and extend this guide to address those or other elements of style and practice.
